

ABSTRACT OF THE DISCLOSURE

A bicycle accessory device includes a bracket mounted on a bicycle frame. The bracket includes a tubular mount having two opposing holes. A support is removably received in the mount of the bracket. When the support is attached to the bracket, the lower end of the support includes two opposing spring biased pins which are received in the opposing holes. The upper end of the support also includes two opposing spring biased pins. A bicycle accessory includes opposing holes is removably attached to the support. When attached, the pins of the supports are received in the holes of the accessory. The accessory can be a storage rack, a flag, a gripping handle, a basket, or a kickstand.
